Major Changes
I have been working on a new project.

What I have accomplished so far
I have cleaned up a dataset on SAH, built an initial model on prediction of DCI based on other life vitals (which does not give satisfying results). I am doing further literature review on how to build a model, with concerns some medical details. I am working with a researcher from Auton Lab to perform frequency decomposition on some waveform data which can also be used in the model, to predict intracranial hypertension or delayed cerebral ischemia.

Meeting my milestone
I have met my milestone of building a basic model with the SAH data.

Surprises
The major surprise of this model is the amount of medical details related, rather than the complexity of the model itself.

Looking Ahead
I plan to finish the majority of the project next week. I will plan my summer research schedule with Professor Dubrawski early next week.

Revisions to my milestones
There is no revision to my milestones.

Resources needed
I have all the resource that I need.
